MTS-V03174

- 2 -

- a reception terminal connected to a reception circuit;
- a first switching element that turns on of off the connection between said antenna terminal and said transmission terminal;
- a second switching element that turns on or off the connection between said antenna terminal and said reception terminal; and
 - filtering means inserted between said first switching element and said antenna terminal,
 - wherein said filtering means (1) attenuates harmonic contents in a transmission signal and (2) has phase characteristics that increase the impedance to a sufficient value from the node between said antenna terminal and said second switching element toward said transmission terminal in a reception frequency band, thereby substantially decreasing leakage of a reception signal toward said filtering means.
- 1 2. (Amended) The transmitting/receiving switch as set forth in claim 1, wherein 2 said filtering means comprises:
- a filter that attenuates harmonic contents in said transmission signal, said harmonic contents resulting from said first switching element; and
- a phase shift circuit that performs phase adjustment on the basis of said phase characteristics according to the amount of phase shift caused by said filter.

8. (Newly Added) The transmitting/receiving switch as set forth in claim 1, wherein said filtering means is a filter having phase characteristics that provides the impedance at a significantly high value.
